

Edgewell Product Safety Principles

At Edgewell, we are guided by product safety and risk assessment principles that are based on best industry practices and standards from scientific bodies and regulatory agencies around the world. So, you can continue to feel confident and trust that both our ingredients and products are safe. Our process ensures our sourcing, safety, regulatory, and quality assurance teams carefully evaluate third-party suppliers so that we partner with those capable of providing good quality raw materials and formulations that are certified as responsibly sourced whenever possible.

Our highly skilled and board-certified toxicologists thoroughly evaluate products before they reach the market to ensure they are safe for consumers to use. Evaluation includes ingredient review, safety testing, and finished product assessment. Safety studies for our products are conducted at specialized, independent research labs using standard methods. In addition to the robust pre-market product safety review process, Edgewell evaluates post-market surveillance reports for consumer feedback after they are released to market. This process ensures that any potential undesirable effects are closely monitored.
