

Package ‘leontief’

June 11, 2024

Type Package

Title Input-Output Analysis

Version 0.3

Description An implementation of the Input-Output model developed by Wassily Leontief that represents the interdependencies between different sectors of a national economy or different regional economies.

augmented_input_requirement
Augmented input requirement

Description

Augmented input requirement

Usage

augmented_input_requirement(X, w, c, d)

Arguments

X	transaction matrix
w	wage vector
c	household consumption vector
d	final demand vector

Examples

```
set.seed(200100)
X <- matrix(rnorm(100), nrow = 10)
w <- rnorm(10)
c <- rnorm(10)
d <- rnorm(10)
augmented_input_requirement(X, w, c, d)
```

backward_linkage	<i>Backward linkage</i>
------------------	-------------------------

Description

Backward linkage

Usage

backward_linkage(A)

Arguments

A input requirement matrix

employment_matrix	<i>Employment matrix (2013 data) This matrix contains the employed people by industry and the employment coefficient that is the number of people divided by the total final demand from the wage and demand matrix.</i>
-------------------	--

Description

Employment matrix (2013 data) This matrix contains the employed people by industry and the employment coefficient that is the number of people divided by the total final demand from the wage and demand matrix.

Usage

wage_demand_matrix

Format

A matrix with 12 rows and 2 columns

Author(s)

University of Bio-Bio, based on data from the National Bureau of Statistics

employment_multiplier *Employment multiplier*

Description

Employment multiplier

Usage

employment_multiplier(L, e)

Arguments

L	Leontief inverse matrix
e	employment coefficients vector

employment_number *Employment number*

Description

Employment number

Usage

employment_number(L, e, c)

Arguments

L	Leontief inverse matrix
e	employment coefficients vector
c	change in final demand

equilibrium_output *Equilibrium output*

Description

Equilibrium output

Usage

```
equilibrium_output(L, d)
```

Arguments

L	Leontief inverse matrix
d	final demand vector

Examples

```
set.seed(200100)
L <- matrix(rnorm(100), nrow = 10)
d <- rnorm(10)
equilibrium_output(L, d)
```

forward_linkage *Forward linkage*

Description

Forward linkage

Usage

```
forward_linkage(A)
```

Arguments

A	input requirement matrix
---	--------------------------

income_multiplier *Income multiplier*

Description

Income multiplier

Usage

```
income_multiplier(L, w)
```

Arguments

L	Leontief inverse matrix
w	wage vector

input_requirement *Input requirement*

Description

Input requirement

Usage

```
input_requirement(X, d)
```

Arguments

X	transaction matrix
d	final demand vector

Examples

```
set.seed(200100)
X <- matrix(rnorm(100), nrow = 10)
d <- rnorm(10)
input_requirement(X, d)
```

leontief_inverse *Leontief inverse*

Description

Leontief inverse

Usage

```
leontief_inverse(A)
```

Arguments

A input requirement matrix

Examples

```
set.seed(200100)
A <- matrix(rnorm(100), nrow = 10)
leontief_inverse(A)
```

multiplier_product_matrix
Multiplier product matrix

Description

Multiplier product matrix

Usage

```
multiplier_product_matrix(L)
```

Arguments

L Leontief inverse matrix

output_allocation *Output allocation*

Description

Output allocation

Usage

```
output_allocation(X, d)
```

Arguments

X	transaction matrix
d	final demand vector

Examples

```
set.seed(200100)
X <- matrix(rnorm(100), nrow = 10)
d <- rnorm(10)
output_allocation(X, d)
```

output_multiplier *Output multiplier*

Description

Output multiplier

Usage

```
output_multiplier(L)
```

Arguments

L	Leontief inverse matrix
---	-------------------------

Examples

```
set.seed(200100)
L <- matrix(rnorm(100), nrow = 10)
output_multiplier(L)
```

power_dispersion *Power of dispersion*

Description

Power of dispersion

Usage

power_dispersion(L)

Arguments

L Leontief inverse matrix

power_dispersion_cv *Power of dispersion coefficient of variation*

Description

Power of dispersion coefficient of variation

Usage

power_dispersion_cv(L)

Arguments

L Leontief inverse matrix

sensitivity_dispersion
Sensitivity of dispersion coefficient of variation

Description

Sensitivity of dispersion coefficient of variation

Usage

sensitivity_dispersion(L)

Arguments

L Leontief inverse matrix

sensitivity_dispersion_cv

Sensitivity of dispersion coefficient of variation

Description

Sensitivity of dispersion coefficient of variation

Usage

sensitivity_dispersion_cv(L)

Arguments

L Leontief inverse matrix

transaction_matrix

Transaction matrix (2013 data) This matrix contains the production of the chilean economy divided into 12 industries. The measuring unit is CLP million of the year 2013

Description

Transaction matrix (2013 data) This matrix contains the production of the chilean economy divided into 12 industries. The measuring unit is CLP million of the year 2013

Usage

transaction_matrix

Format

A matrix with 12 rows and 12 columns

Author(s)

Central Bank of Chile
