“Magic Infoboxes”

Capiunto

- "they shall contain"
- Extension to Scribunto providing basic infobox functionality.
- Consistent and portable Infoboxes
- Easy to use interface for assembling infoboxes.

Convenient for standard use cases

- Current Lua interface:
 - `capiunto:addSubHeader`
 - `capiunto:addImage`
 - `capiunto:addRow`
 - `capiunto:addHeader`
 - `capiunto:addWikitext`
 - Many formatting options

Decoupling from page content

- Separate schema definitions (Wiki-wide)
 - Schema defines possible data fields
 - Schema (possibly) defines allowed value types
 - Schema defines how to get data from Wikidata
- Separated data definition (tied to the page)
 - Possibility to store data in the Wiki
 - Overrides Wikibase-Data
- Restricted Lua modules for data formatting
 - Lua module to use is defined in the schema
 - Lua module must not alter or add data
 - Lua modules don't have access to data from the outside

Implementation sketch
