Preface	ix
Chapter 1. Introduction	1
1.1. Subject matter	1
1.2. Experimental protocols	2
1.3. Multiprecision algorithms and working accuracy	2
1.4. Comments on the GP language	3
1.5. Warnings	7
1.6. Examples	8
Chapter 2. Numerical extrapolation	11
2.1. Introduction	11
2.2. Richardson extrapolation	14
2.3. Interlude: Estimating the number N of nodes	17
2.4. Extrapolating by interpolation: Lagrange	22
2.5. Extrapolation using Sidi's mW algorithm	34
2.6. Computing asymptotic expansions	37
2.7. Sample timings for <code>Limit</code> programs	43
2.8. Conclusion	48
Chapter 3. Numerical integration	51
3.1. Numerical differentiation	51
3.2. Integration of rational functions	57
3.3. Generalities on numerical integration	65
3.4. Newton–Cotes type methods	73
3.5. Orthogonal polynomials	81
3.6. Gaussian integration methods	99
3.7. Gaussian Integration on $[a, \infty]$	121
3.8. Doubly-exponential integration methods (DE)	126
3.9. Integration of oscillatory functions	138
3.10. Sample timings for integrals on $[a, b]$	154
3.11. Sample timings for integrals on $[0, \infty]$	157
3.12. Sample timings for oscillatory integrals	162
3.13. Final conclusion on numerical integration	164
Chapter 4. Numerical summation	165
4.1. Introduction	165
4.2. Euler–Maclaurin summation methods	166
4.3. Pinelis summation	201
4.4. Sums and products of rational functions	204

4.5.	Summation of oscillating series	206
4.6.	Summing by extrapolation	219
4.7.	Van Wijngaarden's method	223
4.8.	Monien summation	224
4.9.	Summing functions defined only on integers	235
4.10.	Multiple sums and multizeta values	236
4.11.	Sample timings for summation programs	245
4.12.	Sample timings for <code>Sumalt</code> programs	249
Chapter 5.	Euler products and Euler sums	253
5.1.	Euler sums	253
5.2.	Euler products	256
5.3.	Variants involving $\log(p)$ or $\log(\log(p))$	257
5.4.	Variants involving quadratic characters	260
5.5.	Variants involving congruences	262
5.6.	Hardy–Littlewood constants: Quadratic polynomials	263
5.7.	Hardy–Littlewood constants: General polynomials	267
Chapter 6.	Gauss and Jacobi sums	273
6.1.	Gauss and Jacobi sums over \mathbb{F}_q	273
6.2.	Practical computations of Gauss and Jacobi sums	278
6.3.	Using the Gross–Koblitz formula	284
6.4.	Gauss and Jacobi sums over $\mathbb{Z}/N\mathbb{Z}$	290
Chapter 7.	Numerical computation of continued fractions	297
7.1.	Generalities	297
7.2.	Naïve numerical computation	298
7.3.	Speed of convergence of infinite continued fractions	300
7.4.	Examples of each convergence case	310
7.5.	Convergence acceleration of continued fractions	319
7.6.	The quotient-difference algorithm	324
7.7.	Evaluation of the quotient-difference output	327
Chapter 8.	Computation of inverse Mellin transforms	331
8.1.	Introduction	331
8.2.	Gamma products	332
8.3.	Compendium of possible methods	335
8.4.	Using the power series around $x = 0$	336
8.5.	Using the asymptotic expansion	338
8.6.	Generalized incomplete Gamma functions	343
Chapter 9.	Computation of L -functions	345
9.1.	The basic setting and goals	345
9.2.	The associated Theta function	346
9.3.	Computing $\Lambda(s)$ and $L(s)$	357
9.4.	Booker–Molin's idea for computing $\Lambda(s)$: Poisson summation	360
9.5.	The Fourier error	363
9.6.	The truncation errors	365
9.7.	Implementation	368
9.8.	A possible program for computing $\Lambda(s)$ and $L(s)$	371

9.9. Applications	374
9.10. Examples	379
9.11. Shifting the line of integration in the Booker–Molin method	386
9.12. Computing $L(s)$ for large $\Im(s)$	387
9.13. Explicit formulas	403
Appendix A. List of relevant GP programs	415
Bibliography	417
Index of Programs	421
General Index	425
